

Analytical Assessment

Lets test your ability to translate complex security rules into Flaw less Formal logic.

Let the domain for x be all employees

Let the domain for y be all servers

Let $A(x,y)$ be the predicate: "Employee x has admin access to server y "

Let $S(x)$ be the predicate: "Employee x is security engineer"

Translate the two English statements into Formal Logic:

1. "There is a server that every employee has admin access to."
2. "Every security engineer has admin access to server y ."

Solution:

$$1 - \exists y \forall x (A(x, y))$$

$$2 - \forall x (S(x) \rightarrow A(x, y))$$
